[RI3K Launches a New Electronic Message Service](#)

For many years people who know about such things have been saying that the insurance market is one bad case away from the credibility of its message security. This release describes the latest effort to address the want of encryption and audit trail in industry communications:-

London, 10th September 2007: RI3K announces today the completion of its new message service for the insurance and reinsurance industry. The service has undergone significant trials to ensure that it is scalable, secure and fit for purpose.

The RI3K Message Service has been designed to exchange placement, accounting and settlement data between brokers and carriers regardless of which back office systems they have implemented.

The solution provides straight through processing to Xchanging and data can be transformed in any format ranging from straightforward email to ACORD standard xml.

The technology behind this service is being provided by Kewill Systems Plc (Kewill) - a global provider of business integration and data messaging solutions.
